

Listing of Claims:

This listing of the claims will replace all prior versions and listings of the claims in the application:

1. (currently amended) An exercise machine for exercising the triceps muscles of a user, comprising:

a frame configured to rest on an underlying surface;

a seat mounted to the frame and configured to receive a seated user;

a pair of support pads mounted to the frame ~~forwardly of and~~ above the seat, each of the support pads being positioned to engage one of the upper arms and the elbows of the seated user;

a pair of movement arm units pivotally interconnected with the frame and movable about respective generally horizontal axes of rotation, each of the pair of movement arm units being configured to engage at least one of the forearms and the hands of the user, each of the pair of movement arm units being movable between a retracted position, in which the seated user's arms are bent, and an extended position, in which the user's arms are extended, the axes of rotation forming an angle of between about 115 and 155 degrees; and

a resistance system connected with the movement arm units that provides resistance to rotation of the movement arm units as they move from the retracted position to the extended position.

2. (original) The exercise machine defined in Claim 1, wherein the seat and frame are configured such that the elevation of the seat relative to the frame is adjustable.

3. (original) The exercise machine defined in Claim 2, wherein the seat elevation is adjustable such that, when the user is seated and the user's upper arms or elbows engage the support pads, the user's upper arms are angled upwardly from shoulder to elbow.

4. (original) The exercise machine defined in Claim 3, wherein the user's upper arms are angled upwardly from shoulder to elbow at an angle of at least 10 degrees.

5. (currently amended) The exercise machine defined in Claim 1, further comprising a backrest positioned rearwardly of and extending upwardly from the seat, the backrest defining a plane that forms an angle of between about ~~75 and 95~~ 60 and 80 degrees with the underlying surface.

6. (original) The exercise machine defined in Claim 1, wherein each of the support pads is positioned so that each of the user's elbows is located on a respective axis of rotation.

7. (original) The exercise machine defined in Claim 1, wherein the angle formed by the axes of rotation is between 135 and 145 degrees.

8. (original) The exercise machine defined in Claim 1, wherein the frame includes pairs of front and rear uprights rising from respective legs, each set of respective front and rear uprights and legs defining a generally vertical plane, the generally vertical planes defining an angle of between about 20 and 70 degrees.

9. (original) The exercise machine defined in Claim 8, wherein the generally vertical planes define an angle of between about 35 and 45 degrees.

10. (original) The exercise machine defined in Claim 1, wherein the resistance system comprises a weight stack.

11. (original) The exercise machine defined in Claim 9, wherein each movement arm unit comprises a cam that pivots about its respective axis of rotation, and wherein the resistance system includes a belt attached to and engaging each cam.

12. (original) The exercise machine defined in Claim 11, wherein each movement arm unit comprises a lever arm attached to each cam and a handle that is pivotally interconnected to the lever arm and engages one of the forearm and hand of the user, the axis

of rotation of the handle relative to the lever arm being substantially parallel to the axis of rotation of the cam relative to the frame.

13. (currently amended) An exercise machine for exercising the triceps muscles of a user, comprising:

- a frame configured to rest on an underlying surface that includes pairs of front and rear uprights rising from respective legs, each set of respective front and rear uprights and legs defining a generally vertical plane, the generally vertical planes defining an angle of between about 20 and 70 degrees;

- a seat mounted to the frame and configured to receive a seated user;

- a pair of pads mounted to the frame ~~forwardly of~~ above the seat, each of the pads being positioned to engage the upper arms of the seated user;

- a pair of movement arm units pivotally interconnected with the frame and movable about respective generally horizontal axes of rotation, each of the pair of movement arm units being configured to engage at least one of the forearms and the hands of the user, each of the pair of movement arm units being movable between a retracted position, in which the seated user's arms are bent, and an extended position, in which the user's arms are extended; and

- a resistance system connected with the movement arm units that provides resistance to rotation of the movement arm units as they move from the retracted position to the extended position.

14. (original) The exercise machine defined in Claim 13, wherein the angle between the generally vertical planes is between about 35 and 45 degrees.

15. (original) The exercise machine defined in Claim 13, wherein the angle between the axes of rotation is between about 135 and 145 degrees.

16. (original) The exercise machine defined in Claim 13, wherein the seat and frame are configured such that the elevation of the seat relative to the frame is adjustable.

17. (original) The exercise machine defined in Claim 16, wherein the seat elevation is adjustable such that, when the user is seated and the user's upper arms or elbows engage the support pads, the user's elbows are angled upwardly from shoulder to elbow.

18. (original) The exercise machine defined in Claim 16, wherein the user's elbows are angled upwardly from shoulder to elbow at an angle of at least 5 degrees.

19. (currently amended) The exercise machine defined in Claim 13, further comprising a backrest positioned rearwardly of and extending upwardly from the seat, the backrest defining a plane that forms an angle of between about ~~75 and 95~~ 60 and 80 degrees with an underlying surface.

20. (original) The exercise machine defined in Claim 13, wherein each of the support pads is positioned so that each of the user's elbows is located on a respective axis of rotation.

21. (original) The exercise machine defined in Claim 13, wherein the resistance system comprises a weight stack.

22. (original) The exercise machine defined in Claim 21, wherein each movement arm unit comprises a cam that pivots about its respective axis of rotation, and wherein the resistance system includes a belt attached to and engaging each cam.

23. (currently amended) The exercise machine defined in Claim ~~13~~ 22, wherein each movement arm unit comprises a lever arm attached to each cam and a handle that is pivotally interconnected to the lever arm and engages one of the forearm and hand of the user, the axis of rotation of the handle relative to the lever arm being substantially parallel to the axis of rotation of the cam relative to the frame.

24. (currently amended) An exercise machine for exercising the triceps muscles of a user, comprising:

a frame configured to rest on an underlying surface;

a seat mounted to the frame and configured to receive a seated user;
a pair of support pads mounted to the frame ~~forwardly of and~~ above the seat,
each of the pads being positioned to engage the upper arms of the seated user;
a pair of movement arm units pivotally interconnected with the frame and
movable about respective axes of rotation, each of the pair of movement arm units being
configured to engage at least one of the forearms and the hands of the user, each of the pair of
movement arm units being movable between a retracted position, in which the seated user's
arms are bent, and an extended position, in which the user's arms are extended, the axes of
rotation forming an angle of between about 115 and 155 degrees;
a weight stack;
a first belt connected with the movement arms;
a second belt connected with the weight stack; and
a pulley bracket, the pulley bracket having a pair of upper pulleys that engage
the first ~~eable~~ belt, the second ~~eable~~ belt being attached to the pulley bracket;
the weight stack, first and second belts, and pulley bracket being configured
such that the weight stack resists movement of the movement arm units from the retracted
position to the extended position.

25. (original) The exercise machine defined in Claim 24, wherein the seat and frame
are configured such that the elevation of the seat relative to the frame is adjustable.

26. (original) The exercise machine defined in Claim 25, wherein the seat height is
adjustable such that, when the user is seated and the user's upper arms or elbows engage the
support pads, the user's elbows are angled upwardly from shoulder to elbow.

27. (original) The exercise machine defined in Claim 26, wherein the user's elbows
are angled upwardly from shoulder to elbow at an angle of at least 5 degrees.

28. (currently amended) The exercise machine defined in Claim 24, further
comprising a backrest positioned rearwardly of and extending upwardly from the seat, the

backrest defining a plane that forms an angle of between about ~~75 and 95~~ 60 and 80 degrees with an underlying surface.

29. (original) The exercise machine defined in Claim 24, wherein each of the support pads is positioned so that each of the user's elbows is located on a respective axis of rotation.

30. (original) The exercise machine defined in Claim 24, wherein the angle formed by the axes of rotation is between 135 and 145 degrees.

31. (original) The exercise machine defined in Claim 24, wherein the frame includes pairs of front and rear uprights rising from respective legs, each set of respective front and rear uprights and legs defining a generally vertical plane, the generally vertical planes defining an angle of between about 20 and 70 degrees.

32. (currently amended) The exercise machine defined in Claim 24, wherein each movement arm unit comprises a cam that pivots about its respective axis of rotation, a lever arm attached to the cam, and a handle that is pivotally interconnected to the lever arm and engages one of the forearm and hand of the user, the axis of rotation of the handle relative to the lever arm being substantially parallel to the axis of rotation of the cam relative to the frame.

33. (currently amended) An exercise machine for exercising the triceps muscles of a user, comprising:

- a frame configured to rest on an underlying surface;
- a seat mounted to the frame and configured to receive a seated user;
- a pair of support pads mounted to the frame ~~forwardly of and~~ above the seat, each of the support pads being positioned to engage one of the upper arms and the elbows of the seated user;
- a pair of movement arm units pivotally interconnected with the frame and movable about respective generally horizontal axes of rotation, each of the pair of movement arm units being configured to engage at least one of the forearms and the hands of the user,

each of the pair of movement arm units being movable between a retracted position, in which the seated user's arms are bent, and an extended position, in which the user's arms are extended; and

a resistance system connected with the movement arm units that provides resistance to rotation of the movement arm units as they move from the retracted position to the extended position;

wherein the elevations of the seat and the support pads are selected such that, when the user is seated and the user's upper arms or elbows engage the support pads, the user's upper arms are angled upwardly from shoulder to elbow at an angle of at least 5 degrees.

34. (currently amended) The exercise machine defined in Claim 33, further comprising a backrest positioned rearwardly of and extending upwardly from the seat, the backrest defining a plane that forms an angle of between about ~~75 and 95~~ 60 and 80 degrees with the underlying surface.

35. (original) The exercise machine defined in Claim 33, wherein each of the support pads is positioned so that each of the user's elbows is located on a respective axis of rotation.

36. (original) The exercise machine defined in Claim 33, wherein the resistance system comprises a weight stack.

37. (original) The exercise machine defined in Claim 36, wherein each movement arm unit comprises a cam that pivots about its respective axis of rotation, and wherein the resistance system includes a belt attached to and engaging each cam.

38. (original) The exercise machine defined in Claim 37, wherein each movement arm unit comprises a lever arm attached to each cam and a handle that is pivotally interconnected to the lever arm and engages one of the forearm and hand of the user, the axis of rotation of the handle relative to the lever arm being substantially parallel to the axis of rotation of the cam relative to the frame.

39. (currently amended) A frame for an exercise machine for exercising the arm muscles of a user, comprising:

pairs of front and rear uprights rising from respective legs, each set of respective front and rear uprights and legs defining a generally vertical plane, the generally vertical planes defining an angle of between about 20 and 70 degrees;

a seat mounted to the frame and configured to receive a seated user; and

a pair of pads mounted to the frame ~~forwardly of~~ above the seat, each of the pads being positioned to engage the upper arms of the seated user;

the frame adapted to receive a pair of movement arm units pivotally interconnected with the frame and movable about respective generally horizontal axes of rotation, each of the pair of movement arm units being configured to engage a portion of the arms or hands of the user, each of the pair of movement arm units being movable between a retracted position, in which the seated user's arms are bent, and an extended position, in which the user's arms are extended.

40. (original) The exercise machine defined in Claim 39, wherein the angle between the generally vertical planes is between about 35 and 45 degrees.

41. (original) The exercise machine defined in Claim 39, wherein the elevations of the seat and the support pads are selected so that the upper arms of the user are angled upwardly from the shoulder to the elbow when the user is in a seated position with his arms engaging the support pads.

42. (original) The exercise machine defined in Claim 41, wherein the upper arms of the user extend upwardly from the shoulder to the elbow at an angle of at least 5 degrees.
